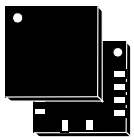
IIS2DH

Ultra-low-power high-performance 3-axis accelerometer with digital output for industrial applications

Datasheet - production data



LGA-12 (2.0x2.0x1 mm)

Features

- Wide supply voltage, 1.71 V to 3.6 V
- Independent IOs supply (1.8 V) and supply voltage compatible
- Ultra-low power consumption down to 2 µA
- ±2*g*/±4*g*/±8*g*/±16*g* selectable full scales
- I^2C/SPI digital output interface
- 3 operating modes: low-power, normal, high-resolution mode
- 2 independent programmable interrupt generators for free-fall and motion detection
- 6D/4D orientation detection
- Motion detection & free-fall detection
- “Sleep-to-wake” and “return-to-sleep” functions
- Embedded FIFO
- Embedded self-test
- Embedded temperature sensor
- ECOPACK®, RoHS and “Green” compliant

Applications

- Robotics
- Anti-tampering devices
- Vibration monitoring
- Tilt/inclination measurements
- Impact recognition and logging
- Industrial tools and factory equipment
- Motion-activated functions

Description

The IIS2DH is an ultra-low-power high-performance three-axis linear accelerometer with digital I^2C/SPI serial interface standard output.

The IIS2DH has user-selectable full scales of ±2*g*/±4*g*/±8*g*/±16*g* and is capable of measuring accelerations with output data rates from 1 Hz to 5.3 kHz.

The device may be configured to generate interrupt signals by two independent inertial wake-up/free-fall events as well as by the position of the device itself.

The self-test capability allows the user to check the functionality of the sensor in the final application.

The IIS2DH is available in a small thin plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range from -40 °C to +85 °C.

Table 1. Device summary

2 Mechanical and electrical specifications

2.1 Mechanical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted[a]

Table 3. Mechanical characteristics

Symbol	Parameter	Test conditions	Min.[1]	Typ.[2]	Max.[1]	Unit
FS	Measurement range[3]	FS bits set to 00		±2.0		*g*
		FS bits set to 01		±4.0		
		FS bits set to 10		±8.0		
		FS bits set to 11		±16.0		
So	Sensitivity	FS bits set to 00; Normal mode	3.52	3.91	4.30	mg/digit
		FS bits set to 00; High-resolution mode	0.88	0.98	1.07	
		FS bits set to 00; Low-power mode	14.06	15.63	17.19	
		FS bits set to 01; Normal mode	7.03	7.81	8.59	mg/digit
		FS bits set to 01; High-resolution mode	1.76	1.95	2.15	
		FS bits set to 01; Low-power mode	28.13	31.25	34.38	
		FS bits set to 10; Normal mode	14.06	15.63	17.19	mg/digit
		FS bits set to 10; High-resolution mode	3.52	3.91	4.30	
		FS bits set to 10; Low-power mode	56.25	62.50	68.75	
		FS bits set to 11; Normal mode	42.25	46.95	51.64	mg/digit
		FS bits set to 11; High-resolution mode	10.55	11.72	12.90	
		FS bits set to 11; Low-power mode	169.81	188.68	207.55	
TCSo	Sensitivity change vs. temperature	FS bits set to 00		±0.01		%/°C
TyOff	Typical zero-*g* level offset accuracy[4]	FS bits set to 00	-90	±40	+90	mg

a. The product is factory calibrated at 2.5 V. The operational power supply range is from 1.71 V to 3.6 V.

Table 3. Mechanical characteristics (continued)

Symbol	Parameter	Test conditions	Min.(1)	Typ.(2)	Max.(1)	Unit
TCOff	Zero-*g* level change vs. temperature	Max delta from 25 °C		±0.5		mg/°C
Vst	Self-test output change(5) (6) (7)	FS bits set to 00 X-axis; Normal mode	17		360	LSb
		FS bits set to 00 Y-axis; Normal mode	17		360	LSb
		FS bits set to 00 Z-axis; Normal mode	17		360	LSb
Top	Operating temperature range		-40		+85	°C

1. Minimum and maximum values are based on characterization data and are not guaranteed
2. Typical specifications are not guaranteed.
3. Verified by wafer level test and measurement of initial offset and sensitivity.
4. Typical zero-g level offset value after factory calibration test at socket level.
5. The sign of “Self-test output change” is defined by the ST bit in *CTRL_REG4 (23h)*, for all axes.
6. “Self-test output change” is defined as the absolute value of:
$OUTPUT[LSb]_{(Self\ test\ enabled)}$ - $OUTPUT[LSb]_{(Self\ test\ disabled)}$. 1LSb = 4 mg at 10-bit representation, ±2 *g* full scale
7. After enabling the ST bit, correct data is obtained after two samples (low-power mode / normal mode) or after eight samples (high-resolution mode).

2.2 Temperature sensor characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted(b)

Table 4. Temperature sensor characteristics

Symbol	Parameter	Min.	Typ.(1)	Max.	Unit
TSDr	Temperature sensor output change vs. temperature		1		digit/°C(2)
TODR	Temperature refresh rate		ODR(3)		Hz
Top	Operating temperature range	-40		+85	°C

1. Typical specifications are not guaranteed.
2. 8-bit resolution.
3. Refer to *Table 28*.

b. The product is factory calibrated at 2.5 V. Temperature sensor operation is guaranteed in the range 2 V - 3.6 V.

2.3 Electrical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted[c]

Table 5. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.[1]	Max.	Unit
Vdd	Supply voltage		1.71	2.5	3.6	V
Vdd_IO	I/O pins supply voltage[2]		1.71		Vdd+0.1	V
Idd	Current consumption in normal mode	50 Hz ODR		11		µA
Idd	Current consumption in normal mode	1 Hz ODR		2		µA
IddLP	Current consumption in low-power mode	50 Hz ODR		6		µA
IddPdn	Current consumption in power-down mode			0.5		µA
VIH	Digital high-level input voltage		0.8*Vdd_IO			V
VIL	Digital low-level input voltage				0.2*Vdd_IO	V
VOH	High-level output voltage		0.9*Vdd_IO			V
VOL	Low-level output voltage				0.1*Vdd_IO	V
Top	Operating temperature range		-40		+85	°C

1. Typical specification are not guaranteed.
2. It is possible to remove Vdd, maintaining Vdd_IO without blocking the communication busses, in this condition the measurement chain is powered off.

c. The product is factory calibrated at 2.5 V. The operational power supply range is from 1.71 V to 3.6 V.

2.4 Communication interface characteristics

2.4.1 SPI - serial peripheral interface

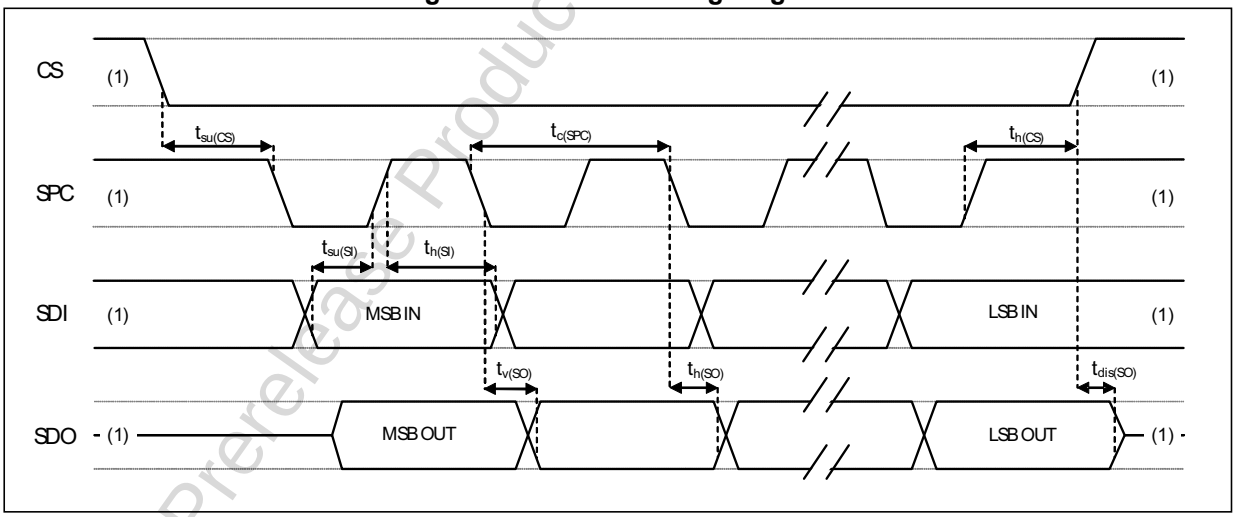
Subject to general operating conditions for Vdd and Top.

Table 6. SPI slave timing values

Symbol	Parameter	Value (1)		Unit
		Min	Max	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	5		ns
$t_{h(CS)}$	CS hold time	20		
$t_{su(SI)}$	SDI input setup time	5		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	5		
$t_{dis(SO)}$	SDO output disable time		50	

1. Values are guaranteed at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results, not tested in production.

Figure 3. SPI slave timing diagram



1. When no communication is ongoing, data on SDO is driven by internal pull-up resistors.

Note: Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both input and output ports.

2.4.2 I²C - inter-IC control interface

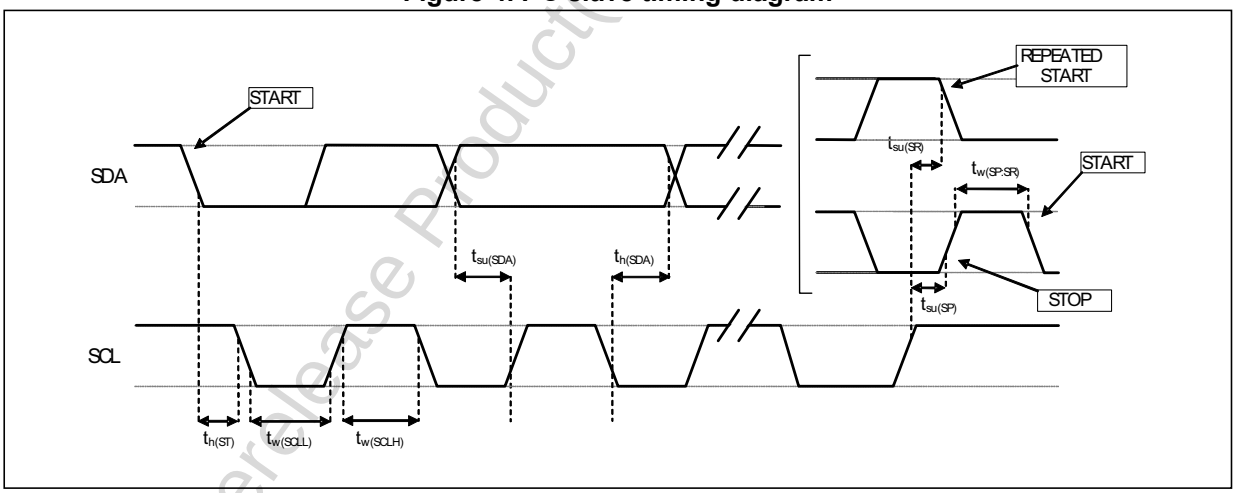
Subject to general operating conditions for Vdd and top.

Table 7. I²C slave timing values

Symbol	Parameter	I²C standard mode (1)		I²C fast mode (1)		Unit
		Min	Max	Min	Max	
$f_{(SCL)}$	SCL clock frequency	0	100	0	400	kHz
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		µs
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		
$t_{su(SDA)}$	SDA setup time	250		100		ns
$t_{h(SDA)}$	SDA data hold time	0	3.45	0	0.9	µs
$t_{h(ST)}$	START condition hold time	4		0.6		µs
$t_{su(SR)}$	Repeated START condition setup time	4.7		0.6		
$t_{su(SP)}$	STOP condition setup time	4		0.6		
$t_{w(SP:SR)}$	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I²C protocol requirement, not tested in production.

Figure 4. I²C slave timing diagram



Note: Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both ports.

2.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
Vdd_IO	Supply voltage on I/O pins	-0.3 to 4.8	V
Vin	Input voltage on any control pin (CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	-0.3 to Vdd_IO +0.3	V
A_{POW}	Acceleration (any axis, powered, Vdd = 2.5 V)	3000 *g* for 0.5 ms	
		10000 *g* for 0.1 ms	
A_{UNP}	Acceleration (any axis, unpowered)	3000 *g* for 0.5 ms	
		10000 *g* for 0.1 ms	
T_{OP}	Operating temperature range	-40 to +85	°C
T_{STG}	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection (HBM)	2	kV

Note: Supply voltage on any pin should never exceed 4.8 V

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

2.6 Terminology and functionality

Terminology

2.6.1 Sensitivity

Sensitivity describes the gain of the sensor and can be determined by applying 1 *g* acceleration to it. As the sensor can measure DC accelerations, this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (pointing to the sky) and noting the output value again. By doing so, ±1 *g* acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and time. The sensitivity tolerance describes the range of sensitivities of a large population of sensors.

2.6.2 Zero-*g* level

The zero-*g* level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 *g* for the X-axis and 0 *g* for the Y-axis whereas the Z-axis will measure 1 *g*. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-*g* offset. Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor on a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see *Table 3* "Zero-*g* level change vs. temperature" (TCOff). The zero-*g* level tolerance (TyOff) describes the standard deviation of the range of zero-*g* levels of a population of sensors.

Functionality

2.6.3 High-resolution, normal mode, low-power mode

The IIS2DH provides three different operating modes: *high-resolution mode*, *normal mode* and *low-power mode*.

The table below summarizes how to select the different operating modes.

Table 9. Operating mode selection

Operating mode	CTRL_REG1[3] (LPen bit)	CTRL_REG4[3] (HR bit)	BW [Hz]	Turn-on time [ms]	So @ ±2 *g* [mg/digit]
Low-power mode (8-bit data output)	1	0	ODR/2	1	16
Normal mode (10-bit data output)	0	0	ODR/2	1.6	4
High-resolution mode (12-bit data output)	0	1	ODR/9	7/ODR	1
Not allowed	1	1	--	--	--

The turn-on time to transition to another operating mode is given in *Table 10*.

Table 10. Turn-on time for operating mode transition

Operating mode change	Turn-on time [ms]
12-bit mode to 8-bit mode	1/ODR
12-bit mode to 10-bit mode	1/ODR
10-bit mode to 8-bit mode	1/ODR
10-bit mode to 12-bit mode	7/ODR
8-bit mode to 10-bit mode	1/ODR
8-bit mode to 12-bit mode	7/ODR

Table 11. Current consumption of operating modes

Operating mode [Hz]	Low-power mode (8-bit data output) [µA]	Normal mode (10-bit data output) [µA]	High resolution (12-bit data output) [µA]
1	2	2	2
10	3	4	4
25	4	6	6
50	6	11	11
100	10	20	20
200	18	38	38
400	36	73	73
1344	--	185	185
1620	100	--	--
5376	185	--	--

2.6.4 Self-test

The self-test allows the user to check the sensor functionality without moving it. When the self-test is enabled, an actuation force is applied to the sensor, simulating a definite input acceleration. In this case the sensor outputs will exhibit a change in their DC levels which are related to the selected full scale through the device sensitivity. When the self-test is activated, the device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force. If the output signals change within the amplitude specified inside *Table 3*, then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

2.6.5 6D / 4D orientation detection

The IIS2DH includes 6D / 4D orientation detection.

6D / 4D orientation recognition

In this configuration the interrupt is generated when the device is stable in a known direction. In 4D configuration, detection of the position of the Z-axis is disabled.

2.6.6 “Sleep-to-wake” and “Return-to-sleep”

The IIS2DH can be programmed to automatically switch to low-power mode upon recognition of a determined event.
Once the event condition is over, the device returns back to the preset normal or high-resolution mode.

To enable this function the desired threshold value must be stored inside the *Act_THS (3Eh)* register while the duration value is written inside the *Act_DUR (3Fh)* register.

When the acceleration falls below the threshold value, the device automatically switches to low-power mode (10Hz ODR).
During this condition, the ODR[3:0] bits and the LPen bit inside *CTRL_REG1 (20h)* and the HR bit in *CTRL_REG3 (22h)* are not considered.

As soon as the acceleration rises above threshold, the module restores the operating mode and ODRs as determined by the *CTRL_REG1 (20h)* and *CTRL_REG3 (22h)* settings.

2.7 Sensing element

A proprietary process is used to create a surface micromachined accelerometer. The technology processes suspended silicon structures which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. To be compatible with traditional packaging techniques, a cap is placed on top of the sensing element to avoid blocking the moving parts during the molding phase of the plastic encapsulation.

When an acceleration is applied to the sensor, the proof mass displaces from its nominal position, causing an imbalance in the capacitive half-bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the capacitor.

At steady state the nominal value of the capacitors are a few pF and when an acceleration is applied, the maximum variation of the capacitive load is in the fF range.

2.8 IC interface

The complete measurement chain is composed of a low-noise capacitive amplifier which converts the capacitive unbalance of the MEMS sensor into an analog voltage that will be available to the user through an analog-to-digital converter.

The acceleration data may be accessed through an I^2C/SPI interface, thus making the device particularly suitable for direct interfacing with a microcontroller.

The IIS2DH features a data-ready signal (DRDY) which indicates when a new set of measured acceleration data is available, thus simplifying data synchronization in the digital system that uses the device.

The IIS2DH may also be configured to generate an inertial wake-up and free-fall interrupt signal according to a programmed acceleration event along the enabled axes. Both free-fall and wake-up can be available simultaneously on two different pins.

2.9 Factory calibration

The IC interface is factory calibrated for sensitivity (So) and zero-*g* level (TyOff).

The trim values are stored inside the device in non-volatile memory. Any time the device is turned on, these values are downloaded into the registers to be used during active operation. This allows using the device without further calibration.

2.10 FIFO

The IIS2DH contains a 10-bit, 32-level FIFO. Buffered output allows the following operation modes: FIFO, Stream, Stream-to-FIFO and FIFO bypass. When FIFO bypass mode is activated, FIFO is not operating and remains empty. In FIFO mode, measurement data from acceleration detection on the x, y, and z axes are stored in the FIFO buffer.

2.11 Temperature sensor

The IIS2DH is supplied with an internal temperature sensor. Temperature data can be enabled by setting the TEMP_EN[1:0] bits to '1' in the *TEMP_CFG_REG (1Fh)* register.

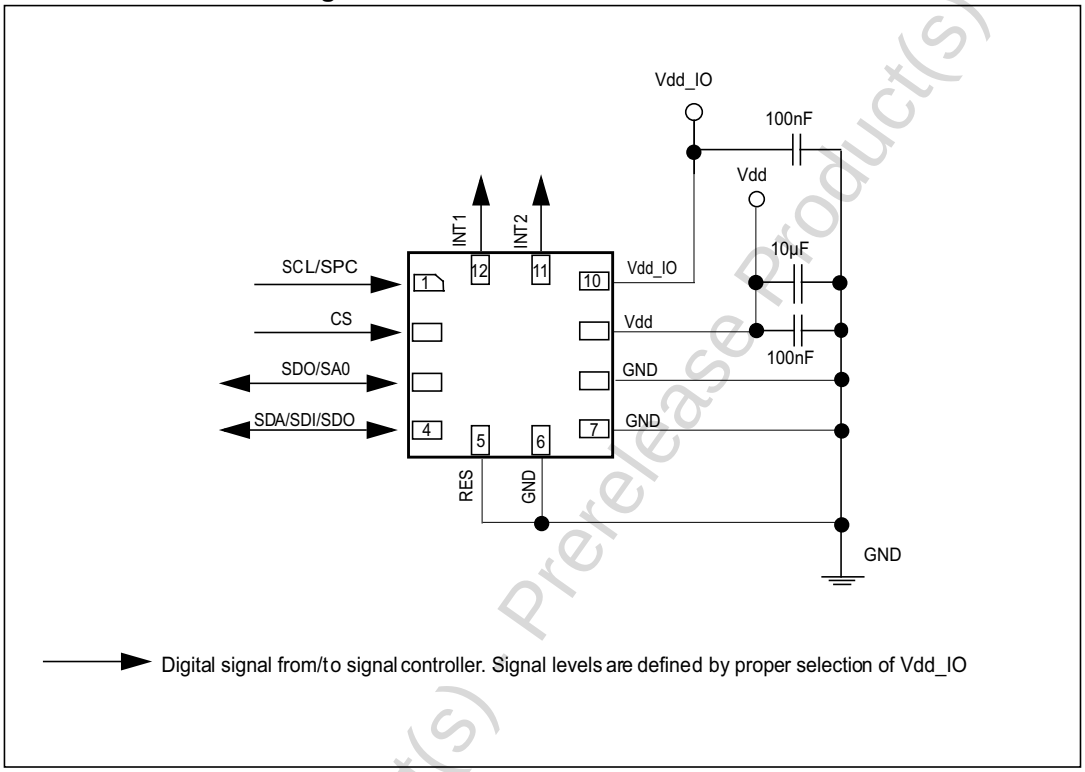
To retrieve the temperature sensor data the BDU bit in *CTRL_REG4 (23h)* must be set to '1'.

Both the *OUT_TEMP_L (0Ch), OUT_TEMP_H (0Dh)* registers must be read.

Temperature data is stored inside OUT_TEMP_H as two's complement data in 8-bit format left-justified.

3 Application hints

Figure 5. IIS2DH electrical connections



The device core is supplied through the Vdd line while the I/O pads are supplied through the Vdd_IO line. Power supply decoupling capacitors (100 nF ceramic, 10 µF aluminum) should be placed as near as possible to pin 9 of the device (common design practice).

All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to *Figure 5*). It is possible to remove Vdd while maintaining Vdd_IO without blocking the communication bus, in this condition the measurement chain is powered off.

The functionality of the device and the measured acceleration data is selectable and accessible through the I^2C or SPI interfaces. When using the I^2C, CS must be tied high.

The functions, the threshold and the timing of the two interrupt pins (INT1 and INT2) can be completely programmed by the user through the I^2C/SPI interface.

3.1 Soldering information

The LGA package is compliant with the ECOPACK®, RoHS and “Green” standard.
It is qualified for soldering heat resistance according to JEDEC J-STD-020.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com.

4 Digital main blocks

4.1 FIFO

The IIS2DH embeds a 32-level FIFO for each of the three output channels, X, Y and Z. This allows consistent power saving for the system, since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

In order to enable the FIFO buffer, the FIFO_EN bit in *CTRL_REG5 (24h)* must be set to '1'.

This buffer can work according to the following different modes: Bypass mode, FIFO mode, Stream mode and Stream-to-FIFO mode. Each mode is selected by the FM [1:0] bits in *FIFO_CTRL_REG (2Eh)*. Programmable FIFO watermark level, FIFO empty or FIFO overrun events can be enabled to generate dedicated interrupts on the INT1 pin (configuration through *CTRL_REG3 (22h)*).

In the *FIFO_SRC_REG (2Fh)* register the EMPTY bit is equal to '1' when all FIFO samples are ready and FIFO is empty.

In the *FIFO_SRC_REG (2Fh)* register the WTM bit goes to '1' if new data is written in the buffer and *FIFO_SRC_REG (2Fh)* (FSS [4:0]) is greater than or equal to *FIFO_CTRL_REG (2Eh)* (FTH [4:0]). *FIFO_SRC_REG (2Fh)* (WTM) goes to '0' if reading an X, Y, Z data slot from FIFO and *FIFO_SRC_REG (2Fh)* (FSS [4:0]) is less than or equal to *FIFO_CTRL_REG (2Eh)* (FTH [4:0]).

In the *FIFO_SRC_REG (2Fh)* register the OVRN_FIFO bit is equal to '1' if the FIFO slot is overwritten.

4.1.1 Bypass mode

In Bypass mode the FIFO is not operational and for this reason it remains empty. For each channel only the first address is used. The remaining FIFO levels are empty.

Bypass mode must be used in order to reset the FIFO buffer when a different mode is operating (i.e. FIFO mode).

4.1.2 FIFO mode

In FIFO mode, the buffer continues filling data from the X, Y and Z accelerometer channels until it is full (a set of 32 samples stored). When the FIFO is full, it stops collecting data from the input channels and the FIFO content remains unchanged.

An overrun interrupt can be enabled, I1_OVERRUN = '1' in the *CTRL_REG3 (22h)* register, in order to be raised when the FIFO stops collecting data. When the overrun interrupt occurs, the first data has been overwritten and the FIFO stops collecting data from the input channels.

After the last read it is necessary to exit Bypass mode in order to reset the FIFO content. After this reset command, it is possible to restart FIFO mode just by selecting the FIFO mode configuration (FM[1:0] bits) in register *FIFO_CTRL_REG (2Eh)*.

4.1.3 Stream mode

In Stream mode the FIFO continues filling data from the X, Y, and Z accelerometer channels until the buffer is full (a set of 32 samples stored) at which point the FIFO buffer index restarts from the beginning and older data is replaced by the current data. The oldest values continue to be overwritten until a read operation frees the FIFO slots.

An overrun interrupt can be enabled, I1_OVERRUN = '1' in the *CTRL_REG3 (22h)* register, in order to read the entire contents of the FIFO at once. If, in the application, it is mandatory not to lose data and it is not possible to read at least one sample for each axis within one ODR period, a watermark interrupt can be enabled in order to read partially the FIFO and leave memory slots free for incoming data.

Setting the FTH [4:0] bit in the *FIFO_CTRL_REG (2Eh)* register to an N value, the number of X, Y and Z data samples that should be read at the rise of the watermark interrupt is up to (N+1).

4.1.4 Stream-to-FIFO mode

In Stream-to-FIFO mode, data from the X, Y and Z accelerometer channels are collected in a combination of Stream mode and FIFO mode. The FIFO buffer starts operating in Stream mode and switches to FIFO mode when the selected interrupt occurs.

The FIFO operating mode changes according to the INT1 pin value if the TR bit is set to ‘0’ in the *FIFO_CTRL_REG (2Eh)* register or the INT2 pin value if the TR bit is set to‘1’ in the *FIFO_CTRL_REG (2Eh)* register.

When the interrupt pin is selected and the interrupt event is configured on the corresponding pin, the FIFO operates in Stream mode if the pin value is equal to ‘0’ and it operates in FIFO mode if the pin value is equal to ‘1’. Switching modes is dynamically performed according to the pin value.

Stream-to-FIFO can be used in order to analyze the sampling history that generates an interrupt. The standard operation is to read the contents of FIFO when the FIFO mode is triggered and the FIFO buffer is full and stopped.

4.1.5 Retrieving data from FIFO

FIFO data is read from *OUT_X_L (28h), OUT_X_H (29h)*, *OUT_Y_L (2Ah), OUT_Y_H (2Bh)* and *OUT_Z_L (2Ch), OUT_Z_H (2Dh)*. When the FIFO is in Stream, Stream-to-FIFO or FIFO mode, a read operation to the *OUT_X_L (28h), OUT_X_H (29h)*, *OUT_Y_L (2Ah), OUT_Y_H (2Bh)* or *OUT_Z_L (2Ch), OUT_Z_H (2Dh)* registers provides the data stored in the FIFO. Each time data is read from the FIFO, the oldest X, Y and Z data are placed in the *OUT_X_L (28h), OUT_X_H (29h)*, *OUT_Y_L (2Ah), OUT_Y_H (2Bh)* and *OUT_Z_L (2Ch), OUT_Z_H (2Dh)* registers and both single read and read-burst operations can be used.

The address to be read is automatically updated by the device and it rolls back to 0x28 when register 0x2D is reached. In order to read all FIFO levels in a multiple byte read, 192 bytes (6 output registers of 32 levels) have to be read.

5 Digital interfaces

The registers embedded inside the IIS2DH may be accessed through both the I^2C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped to the same pads. To select/exploit the I^2C interface, the CS line must be tied high (i.e. connected to Vdd_IO).

Table 12. Serial interface pin description

Pin name	Pin description
CS	SPI enable I^2C/SPI mode selection: 1: SPI idle mode / I^2C communication enabled 0: SPI communication mode / I^2C disabled
SCL SPC	I^2C serial clock (SCL) SPI serial port clock (SPC)
SDA SDI SDO	I^2C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SA0 SDO	I^2C less significant bit of the device address (SA0) SPI serial data output (SDO)

5.1 I^2C serial interface

The IIS2DH I^2C is a bus slave. The I^2C is employed to write data into registers whose content can also be read back.

The relevant I^2C terminology is given in the table below.

Table 13. I^2C terminology

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I^2C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving data to/from the interface. Both the lines must be connected to Vdd_IO through an external pull-up resistor. When the bus is free, both the lines are high.

The I^2C interface is compliant with fast mode (400 kHz) I^2C standards as well as with the normal mode.

5.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a high-to-low transition on the data line while the SCL line is held HIGH. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The Slave ADdress (SAD) associated to the IIS2DH is 001100xb. The **SDO**/**SA0** pad can be used to modify the less significant bit of the device address. If the SA0 pad is connected to the voltage supply, LSb is '1' (address 0011001b), else if the SA0 pad is connected to ground, the LSb value is '0' (address 0011000b). This solution permits to connect and address two different accelerometers to the same I²C lines.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the IIS2DH behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted: the 7 LSb represent the actual register address while the MSB enables address auto increment. If the MSb of the SUB field is '1', the SUB (register address) is automatically increased to allow multiple data read/writes.

The slave address is completed with a Read/Write bit. If the bit was '1' (Read), a repeated START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (Write) the master will transmit to the slave with direction unchanged. *Table 14* explains how the SAD+read/write bit pattern is composed, listing all the possible configurations.

Table 14. SAD+read/write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W
Read	001100	0	1	00110001 (31h)
Write	001100	0	0	00110000 (30h)
Read	001100	1	1	00110011 (33h)
Write	001100	1	0	00110010 (32h)

Table 15. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 16. Transfer when master is writing multiple bytes to slave

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 17. Transfer when master is receiving (reading) one byte of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Table 18. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left HIGH by the slave. The master can then abort the transfer. A low-to-high transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1 while SUB(6-0) represents the address of the first register to be read.

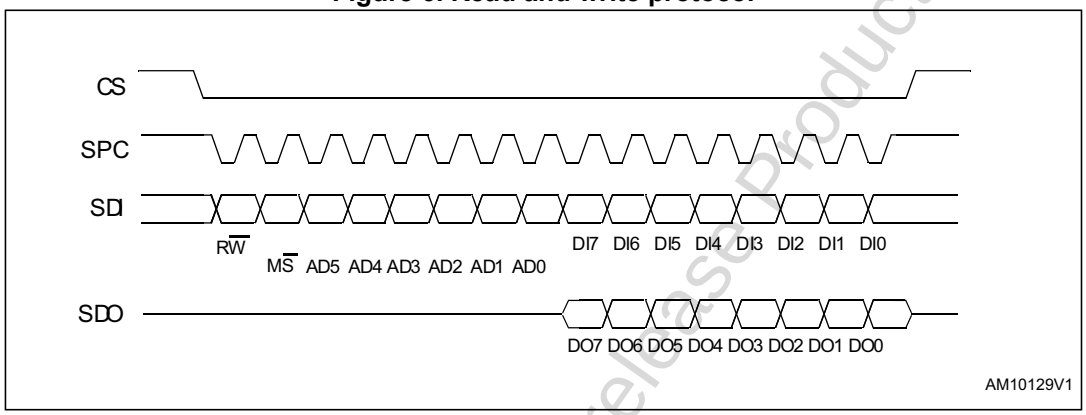
In the presented communication format MAK is Master acknowledge and NMAK is No Master Acknowledge.

5.2 SPI bus interface

The IIS2DH SPI is a bus slave. The SPI allows writing to and reading from the registers of the device.

The serial interface interacts with the outside world with 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 6. Read and write protocol



CS is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. These lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of SPC just before the rising edge of **CS**.

bit 0: R$\overline{W}$ bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip will drive **SDO** at the start of bit 8.

bit 1: M$\overline{S}$ bit. When 0, the address will remain unchanged in multiple read/write commands. When 1, the address is auto incremented in multiple read/write commands.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

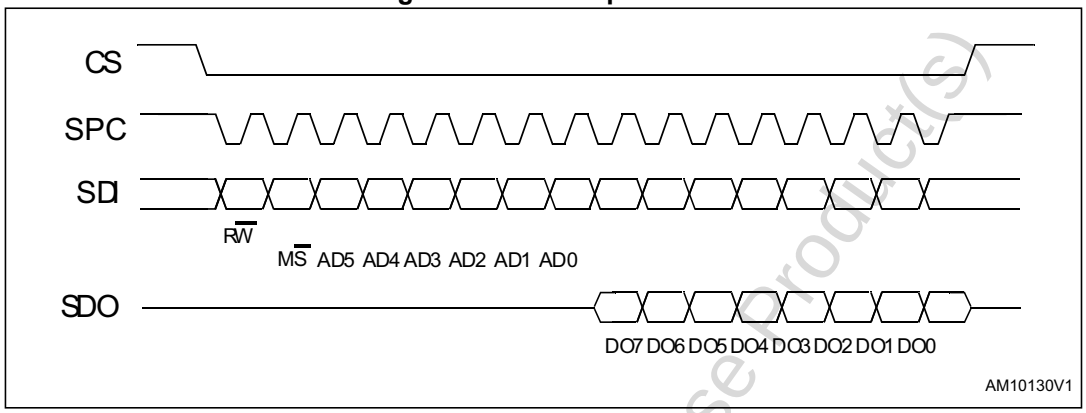
bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When the M$\overline{S}$ bit is '0', the address used to read/write data remains the same for every block. When the M$\overline{S}$ bit is '1', the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.2.1 SPI read

Figure 7. SPI read protocol



The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: READ bit. The value is 1.

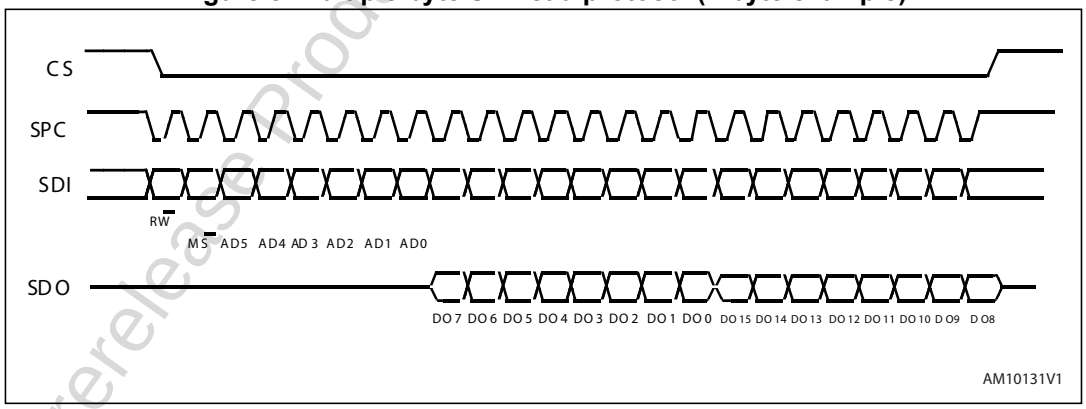
bit 1: MS bit. When 0, does not increment the address, when 1, increments the address in multiple reads.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

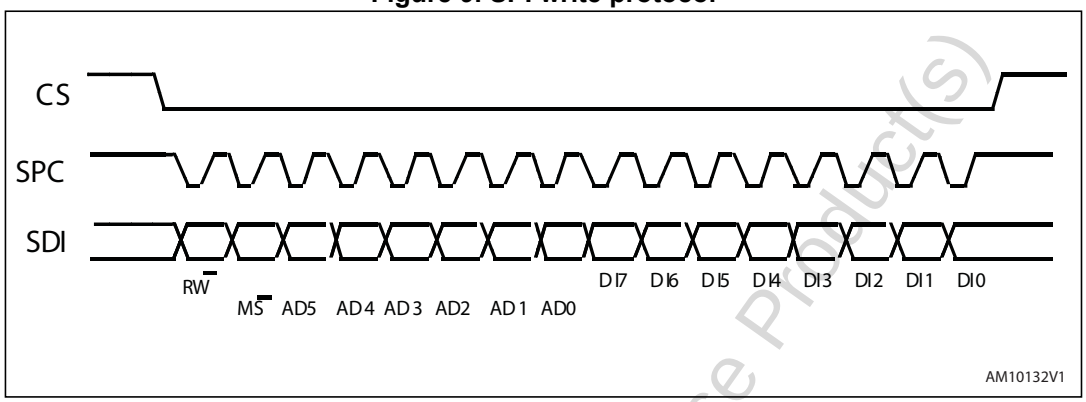
bit 16-... : data DO(...-8). Further data in multiple byte reads.

Figure 8. Multiple byte SPI read protocol (2-byte example)



5.2.2 SPI write

Figure 9. SPI write protocol



The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: WRITE bit. The value is 0.

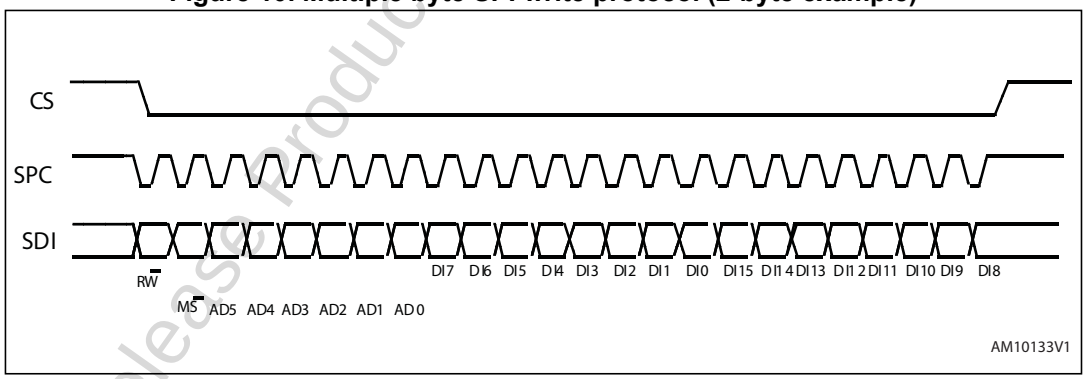
bit 1: MS bit. When 0, does not increment the address, when 1, increments the address in multiple writes.

bit 2 -7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

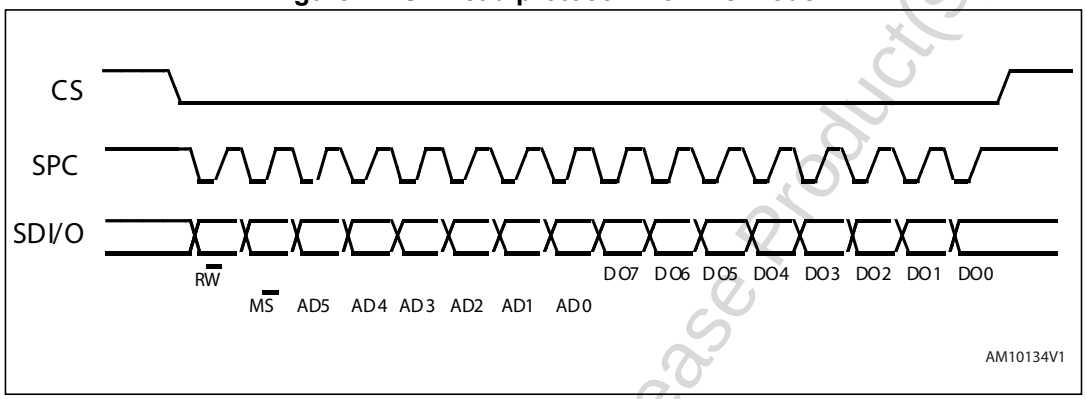
Figure 10. Multiple byte SPI write protocol (2-byte example)



5.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting bit SIM (SPI serial interface mode selection) to '1' in *CTRL_REG4 (23h)*.

Figure 11. SPI read protocol in 3-wire mode



The SPI read command is performed with 16 clock pulses.

bit 0: READ bit. The value is 1.

bit 1: $\overline{MS}$ bit. When 0, does not increment the address, when 1, increments the address in multiple reads.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

The multiple read command is also available in 3-wire mode.

6 Register mapping

The table given below provides a listing of the 8-bit registers embedded in the device and the corresponding addresses.

Table 19. Register address map

Name	Type	Register address		Default	Comment
		Hex	Binary		
Reserved		00 - 06			Reserved
STATUS_REG_AUX	r	07	000 0111		
Reserved	r	08-0B			Reserved

Act_THS	rw	3E	011 1110	00000000	
Act_DUR	rw	3F	011 1111	00000000	

Registers marked as *Reserved* or not listed in the table above must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

The boot procedure is complete about 5 milliseconds after device power-up.

7 Register description

7.1 STATUS_REG_AUX (07h)

Table 20. STATUS_REG_AUX register

--	TOR	--	--	--	TDA	--	--

Table 21. STATUS_REG_AUX description

TOR	Temperature data overrun. Default value: 0 (0: no overrun has occurred; 1: new temperature data has overwritten the previous data)
TDA	Temperature new data available. Default value: 0 (0: new temperature data is not yet available; 1: new temperature data is available)

7.2 OUT_TEMP_L (0Ch), OUT_TEMP_H (0Dh)

Temperature sensor data. Refer to *Section 2.11: Temperature sensor* for details on how to enable and read the temperature sensor output data.

7.3 INT_COUNTER_REG (0Eh)

Table 22. INT_COUNTER_REG register

IC7	IC6	IC5	IC4	IC3	IC2	IC1	IC0

7.4 WHO_AM_I (0Fh)

Device identification register.

TEMP_EN[1:0]	Temperature sensor (T) enable. Default value: 00 (00: T disabled; 11: T enabled)

7.6 CTRL_REG1 (20h)

Table 26. CTRL_REG1 register

ODR3	ODR2	ODR1	ODR0	LPen	Zen	Yen	Xen

Table 27. CTRL_REG1 description

ODR[3:0]	Data rate selection. Default value: 0000 (0000: power-down mode; others: refer to *Table 28*)
LPen	Low-power mode enable. Default value: 0 (0: normal mode, 1: low-power mode) (Refer to section *2.6.3: High-resolution, normal mode, low-power mode*)
Zen	Z-axis enable. Default value: 1 (0: Z-axis disabled; 1: Z-axis enabled)
Yen	Y-axis enable. Default value: 1 (0: Y-axis disabled; 1: Y-axis enabled)
Xen	X-axis enable. Default value: 1 (0: X-axis disabled; 1: X-axis enabled)

ODR[3:0] is used to set the power mode and ODR selection. The following table indicates the frequency of each combination of ODR[3:0].

Table 28. Data rate configuration

ODR3	ODR2	ODR1	ODR0	Power mode selection
0	0	0	0	Power-down mode
0	0	0	1	HR / Normal / Low-power mode (1 Hz)
0	0	1	0	HR / Normal / Low-power mode (10 Hz)
0	0	1	1	HR / Normal / Low-power mode (25 Hz)
0	1	0	0	HR / Normal / Low-power mode (50 Hz)
0	1	0	1	HR / Normal / Low-power mode (100 Hz)
0	1	1	0	HR / Normal / Low-power mode (200 Hz)
0	1	1	1	HR/ Normal / Low-power mode (400 Hz)
1	0	0	0	Low-power mode (1.620 kHz)
1	0	0	1	HR/ Normal (1.344 kHz); Low-power mode (5.376 kHz)

1	1	Stream-to-FIFO mode

7.18 FIFO_SRC_REG (2Fh)

Table 49. FIFO_SRC_REG register

WTM	OVRN_FIFO	EMPTY	FSS4	FSS3	FSS2	FSS1	FSS0

Table 50. FIFO_SRC_REG description

WTM	WTM bit is set high when FIFO content exceeds watermark level.
OVRN_FIFO	OVRN bit is set high when FIFO buffer is full; this means that the FIFO buffer contains 32 unread samples. At the following ODR a new sample set replaces the oldest FIFO value. The OVRN bit is set to 0 when the first sample set has been read.
EMPTY	EMPTY flag is set high when all FIFO samples have been read and FIFO is empty.
FSS [4:0]	FSS [4:0] field always contains the current number of unread samples stored in the FIFO buffer. When FIFO is enabled, this value increases at ODR frequency until the buffer is full, whereas, it decreases every time one sample set is retrieved from FIFO.

7.19 INT1_CFG (30h)

Table 51. INT1_CFG register

AOI	6D	ZHIE/ ZUPE	ZLIE/ ZDOWNE	YHIE/ YUPE	YLIE/ YDOWNE	XHIE/ XUPE	XLIE/ XDOWNE

Table 52. INT1_CFG description

AOI	And/Or combination of interrupt events. Default value: 0. Refer to *Table 53*
6D	6-direction detection function enabled. Default value: 0. Refer to *Table 53*
ZHIE/ ZUPE	Enable interrupt generation on Z high event or on direction recognition. Default value: 0 (0: disable interrupt request;1: enable interrupt request)
ZLIE/ ZDOWNE	Enable interrupt generation on Z low event or on direction recognition. Default value: 0 (0: disable interrupt request;1: enable interrupt request)
YHIE/ YUPE	Enable interrupt generation on Y high event or on direction recognition. Default value: 0 (0: disable interrupt request; 1: enable interrupt request.)
YLIE/ YDOWNE	Enable interrupt generation on Y low event or on direction recognition. Default value: 0 (0: disable interrupt request; 1: enable interrupt request.)
XHIE/ XUPE	Enable interrupt generation on X high event or on direction recognition. Default value: 0 (0: disable interrupt request; 1: enable interrupt request.)
XLIE/ XDOWNE	Enable interrupt generation on X low event or on direction recognition. Default value: 0 (0: disable interrupt request; 1: enable interrupt request.)

The content of this register is loaded at boot.

A write operation to this address is possible only after system boot.

Table 53. Interrupt mode

AOI	6D	Interrupt mode
0	0	OR combination of interrupt events
0	1	6-direction movement recognition
1	0	AND combination of interrupt events
1	1	6-direction position recognition

The difference between AOI-6D = ‘01’ and AOI-6D = ‘11’.

AOI-6D = ‘01’ is movement recognition. An interrupt is generated when the orientation moves from an unknown zone to a known zone. The interrupt signal remains for a duration ODR.

AOI-6D = ‘11’ is direction recognition. An interrupt is generated when the orientation is inside a known zone. The interrupt signal remains while the orientation is inside the zone.

7.20 INT1_SRC (31h)

Table 54. INT1_SRC register

0	IA	ZH	ZL	YH	YL	XH	XL

Table 55. INT1_SRC description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt 1 source register. Read-only register.

Reading at this address clears the *INT1_SRC (31h)* IA bit (and the interrupt signal on the INT1 pin) and allows the refresh of data in the *INT1_SRC (31h)* register if the latched option was chosen.

7.21 INT1_THS (32h)

Table 56. INT1_THS register

0	THS6	THS5	THS4	THS3	THS2	THS1	THS0

Table 57. INT1_THS description

THS[6:0]	Interrupt 1 threshold. Default value: 000 0000 1 LSb = 16 mg @ FS = 2 *g* 1 LSb = 32 mg @ FS = 4 *g* 1 LSb = 62 mg @ FS = 8 *g* 1 LSb = 186 mg @ FS = 16 *g*

7.22 INT1_DURATION (33h)

Table 58. INT1_DURATION register

0	D6	D5	D4	D3	D2	D1	D0

Table 59. INT1_DURATION description

D[6:0]	Duration value. Default value: 000 0000 1 LSb = 1/ODR

The **D[6:0]** bits set the minimum duration of the interrupt 1 event to be recognized. Duration steps and maximum values depend on the ODR chosen.

Duration time is measured in N/ODR, where N is the content of the duration register.

7.23 INT2_CFG (34h)

Table 60. INT2_CFG register

AOI	6D	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE

Table 61. INT2_CFG description

AOI	AND/OR combination of interrupt events. Default value: 0 (see *Table 62*)
6D	6-direction detection function enabled. Default value: 0. Refer to *Table 62.*
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)

Table 61. INT2_CFG description (continued)

YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)

The content of this register is loaded at boot.

A write operation to this address is possible only after system boot.

Table 62. Interrupt mode

AOI	6D	Interrupt mode
0	0	OR combination of interrupt events
0	1	6-direction movement recognition
1	0	AND combination of interrupt events
1	1	6-direction position recognition

The difference between AOI-6D = ‘01’ and AOI-6D = ‘11’.

AOI-6D = ‘01’ is movement recognition. An interrupt is generated when the orientation moves from an unknown zone to a known zone. The interrupt signal remains for a duration ODR.

AOI-6D = ‘11’ is direction recognition. An interrupt is generated when the orientation is inside a known zone. The interrupt signal remains while the orientation is inside the zone.

7.24 INT2_SRC (35h)

Table 63. INT2_SRC register

0	IA	ZH	ZL	YH	YL	XH	XL

Table 64. INT2_SRC description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)

Table 64. INT2_SRC description (continued)

YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt 2 source register. Read-only register.

Reading at this address clears the *INT2_SRC (35h)* IA bit (and the interrupt signal on the INT2 pin) and allows the refresh of data in the *INT2_SRC (35h)* register if the latched option was chosen.

7.25 INT2_THS (36h)

Table 65. INT2_THS register

0	THS6	THS5	THS4	THS3	THS2	THS1	THS0

Table 66. INT2_THS description

THS[6:0]	Interrupt 2 threshold. Default value: 000 0000 1 LSb = 16 m*g* @ FS = 2 *g* 1 LSb = 32 m*g* @ FS = 4 *g* 1 LSb = 62 m*g* @ FS = 8 *g* 1 LSb = 186 m*g* @ FS = 16 *g*

7.26 INT2_DURATION (37h)

Table 67. INT2_DURATION register

0	D6	D5	D4	D3	D2	D1	D0

Table 68. INT2_DURATION description

D[6:0]	Duration value. Default value: 000 0000 1 LSb = 1/ODR(1)

1. Duration time is measured in N/ODR, where N is the content of the duration register.

The **D[6:0]** bits set the minimum duration of the Interrupt 2 event to be recognized. Duration time steps and maximum values depend on the ODR chosen.

7.27 CLICK_CFG (38h)

Table 69. CLICK_CFG register

--	--	ZD	ZS	YD	YS	XD	XS

Table 70. CLICK_CFG description

ZD	Enable interrupt double-click on Z-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
ZS	Enable interrupt single-click on Z-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
YD	Enable interrupt double-click on Y-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
YS	Enable interrupt single-click on Y-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
XD	Enable interrupt double-click on X-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
XS	Enable interrupt single-click on X-axis. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)

7.28 CLICK_SRC (39h)

Table 71. CLICK_SRC register

	IA	DClick	SClick	Sign	Z	Y	X

Table 72. CLICK_SRC description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
DClick	Double-click enable. Default value: 0 (0: double-click detection disabled, 1: double-click detection enabled)
SClick	Single-click enable. Default value: 0 (0: single-click detection disabled, 1: single-click detection enabled)
Sign	Click sign. 0: positive detection, 1: negative detection
Z	Z click detection. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
Y	Y click detection. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
X	X click detection. Default value: 0 (0: no interrupt, 1: X high event has occurred)

7.29 CLICK_THS (3Ah)

Table 73. CLICK_THS register

-	Ths6	Ths5	Ths4	Ths3	Ths2	Ths1	Ths0

Table 74. CLICK_SRC description

Ths[6:0]	Click threshold. Default value: 000 0000

7.30 TIME_LIMIT (3Bh)

Table 75. TIME_LIMIT register

-	TLI6	TLI5	TLI4	TLI3	TLI2	TLI1	TLI0

Table 76. TIME_LIMIT description

TLI[6:0]	Click time limit. Default value: 000 0000

7.31 TIME_LATENCY (3Ch)

Table 77. TIME_LATENCY register

TLA7	TLA6	TLA5	TLA4	TLA3	TLA2	TLA1	TLA0

Table 78. TIME_LATENCY description

TLA[7:0]	Click time latency. Default value: 0000 0000

7.33 Act_THS (3Eh)

Table 81. Act_THS register

--	Acth6	Acth5	Acth4	Acth3	Acth2	Acth1	Acth0

Table 82. Act_THS description

Acth[6:0]	Sleep-to-wake, return-to-sleep activation threshold in low-power mode 1 LSb = 16 m*g* @ FS = 2 *g* 1 LSb = 32 m*g* @ FS = 4 *g* 1 LSb = 62 m*g* @ FS = 8 *g* 1 LSb = 186 m*g* @ FS = 16 *g*

7.34 Act_DUR (3Fh)

Table 83. Act_DUR register

ActD7	ActD6	ActD5	ActD4	ActD3	ActD2	ActD1	ActD0

Table 84. Act_DUR description

ActD[7:0]	Sleep-to-wake, return-to-sleep duration 1 LSb = (8*1[LSb]+1)/ODR

8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK® is an ST trademark.

8.1 LGA package information
